

“How to Recognize GOOD LIGHTS at the End of the Tunnel & Realizing When Another TRAIN May Be Coming Thru”

By Jimmy Hixson

The broader topic for the talk has to do with "understanding and measuring risk in the stock market". In my opinion there are 2 approaches that help. The Dominant Market theory helps measure risk at the current time by knowing "When the wind is at your back". I have found a way to break the 4 year cycle up into a couple general areas and that helps you know when the "Tide is turning".

Market Risk

1. Measuring Risk in the Stock Market has always been difficult. The Dominant Market Theory can help you realize when risk in the stock market is rising and therefore that light at the other end of the tunnel could be another TRAIN coming thru.

Topics we will discuss:

- (1) How do you measure Risk in the Stock Market?
- (2) Looking at Historical Risk Reward Results
- (3) The System will help You decide:
 - When to be Aggressive,
 - When You should reduce your market exposure.
 - Where should You Invest when risk is Rising!

Four Year Presidential Cycle

2. Applying the KISS principle to the 4 year Presidential Cycle can make it much easier to understand and use.

Topics we will discuss:

- (1.) Simplifying the 4 Year of the President Cycle.
- (2.) Breaking the Cycle down into Areas
- (3.) Historical results using simpler approach.

A Little Cajun Humor will lighten the day.
